

**BARTELL CORPORATION**

Dear Vega "30" Owner:

The Bartell, BV-V30 Corrosion System on your Vega "30" is comprised of the following:

1. Controller with Protective Current Meter.
2. Mounting-Pad, Bottom Type.
3. Zinc, Mil Spec A 18001 G, with Counter Sunk Mounting Holes.
4. Wiper Brush

The BC-V30 System was engineered especially for your Vega and the controller is non-adjustable. Normal reading of the meter is from 100 to 200 Milliamperes.

When you are underway it is normal for the Controller to read higher than usual.

If the reading should go to zero, it means that the zinc is used up or it is loose.

If the reading goes all the way to the right chances are there is a connection from your boat to the dock or to another boat.

The zinc should last approximately one year. When you replace the zinc be sure to specify Mil Spec A 18001 G or equal. If the wrong zinc is used the system might not provide the protection you want.
